## Preface

Two metric parameters pM and $\mathrm{pL}_{0.5}$ are commonly used to evaluate metal sequestering ability of ligands. The pM value is defined as $\mathrm{pM}=-\log [\mathrm{M}]$, where $[\mathrm{M}]$ represents the concentration of the free ion $\left[\mathrm{M}^{n+}\right]$ in the particular systems ( $c_{L} / c_{M}=10, c_{M}=10^{-6} \mathrm{M}, \mathrm{pH}=7.4$, where $c_{L}$ and $c_{M}$ are total concentrations of a ligand and a metal ion, respectively), while the parameter $\mathrm{pL}_{0.5}$ is defined as $\mathrm{pL}_{0.5}=-\log c_{\llcorner }$when $50 \%$ of the metal cation present in traces ( $c_{M} \leq 10^{-12} \mathrm{M}$ ) bind to a ligand.

## Problem

Ethylenediamine- $N, N, N^{\prime}, N^{\prime}$-tetraacetic acid (EDTA, $\mathrm{H}_{4} \mathrm{Y}$ ) and gramibactin (GBT, $\mathrm{H}_{4} \mathrm{G}$ ) are both tetraprotic acids whose conjugate bases form 1:1 complexes with a ferric ion. Considerable equilibria and their equilibrium constants are listed in Table 1. All the other chemical species that appear in Table 1 are neglected in this problem.

ethylenediamine- $N, N, N^{\prime}, N^{\prime}-$ tetraacetic acid (EDTA)

gramibactin (GBT)
(1) Calculate pFe values of EDTA and GBT in $T=298.15 \mathrm{~K}$.
(2) Calculate $\mathrm{pL}_{0.5}$ values of EDTA and GBT in $T=298.15 \mathrm{~K}$ when complexed with $\mathrm{Fe}^{3+}$ in the given three cases; (i) pH 2.5 , (ii) pH 7.4 , (iii) pH 10.5 .

Table 1. Protonation constants for EDTA and $\mathrm{GBT}, \mathrm{Fe}^{3+}$ hydrolysis, and $\mathrm{Fe}^{3+} / E D T A, \mathrm{Fe}^{3+} / \mathrm{GBT}$ complex formation constants $\left(\log \beta_{\text {pqr }}\right)$ in $T=298.15 \mathrm{~K}$.

$$
p \mathrm{Fe}^{3+}+q \mathrm{~L}^{4-}+r \mathrm{H}^{+} \rightleftarrows \mathrm{Fe}_{p} \mathrm{~L}_{q} \mathrm{H}_{r}{ }^{(3 p-4 q+r)} \quad(\mathrm{L}=\mathrm{Y} \text { or G }) \quad \beta_{p q r}=\left[\mathrm{Fe}_{p} \mathrm{~L}_{q} \mathrm{H}_{r}(3 p-4 q+r)\right] /\left[\mathrm{Fe}^{3+}\right]^{p}\left[\mathrm{~L}^{4-}\right]^{q}\left[\mathrm{H}^{+}\right]^{r}

## Problem Session Answer

2023. 7.15.

Topic: Quantitative evaluation of metal sequestering ability of ligands

## 1. Evaluation of metal sequestering ability

Since the sequestering ability of a ligand is strictly dependent on the stability of side species as well as that of the complex, it is necessary to consider competitive reactions involving simultaneous equilibria in different conditions. Therefore, the selectivity and the whole sequestering ability of a chelator toward a cation, as well as the comparison between two or more chelators, cannot be easily assessed by the simple analysis of single sets of stability constants of metal/ligand complexes in real conditions ${ }^{1,2}$.

For this reason, the concentration of free metal ion in solution at equilibrium ( pM ) was introduced to compare the relative strength of different metal chelating agents ${ }^{3}$. In the view of fair comparison, pM is defined in $c_{\llcorner } / c_{M}=$ $10, c_{\mathrm{M}}=10^{-6} \mathrm{M}, \mathrm{pH}=7.4$ as the values are strictly conditional depending on total concentration of reagents and pH (Figure 1 left). Notably, this parameter should be used with care when performed on different cations because they undergo different hydrolysis.

To avoid the drawback of pM , the parameter pL 0.5 has been employed since it does not refer the free metal concentration as long as metal species are present as trace ${ }^{4}$. In the conditions, the fraction of metal complexed by the ligand $x_{M}$ is expressed as sigmoidal dose-response curve of pL ( $=-\log c_{\mathrm{L}}$ ) (Figure 1 right)

$$
\begin{equation*}
x_{M}=\frac{1}{1+10^{\mathrm{pL}-\mathrm{pL}_{0} .5}} \tag{1-1}
\end{equation*}
$$

In principle, the $\mathrm{pL}_{0.5}$ values can be advantageously used for the comparison of systems with the presence of other cations and ligands undergoing many different competing equilibria, even under different conditions of pH and temperature.

Figure 1. Speciation diagram for complex formation of EDTA with $\mathrm{Fe}^{3+}\left(c_{\mathrm{L}}=10^{-5} \mathrm{M}, c_{\mathrm{Fe}}=10^{-6} \mathrm{M}, \mathrm{pH}=7.4\right)(\text { left })^{5}$ and generic sequestration diagram for the calculation of $\mathrm{pL}_{0.5}$ (right).

## 2. Description of the total equilibrium system

To demonstrate these parameters, the simplest one metal one ligand system in aqueous solution is considered in this problem. The sequestration ability of gramibactin ${ }^{1,6,7}$ was evaluated in comparison with EDTA. Complex formation reactions and competing side reactions are described in equilibria (2-1)-(2-13) with corresponding equilibrium constants.

- Complex formation constants

$$
\begin{array}{ll}
\mathrm{Fe}^{3+}+\mathrm{Y}^{4-} \rightleftarrows \mathrm{FeY}^{-} & \beta_{\mathrm{FeY}}=\frac{\left[\mathrm{FeY}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{Y}^{4-}\right]} \\
\mathrm{Fe}^{3+}+\mathrm{G}^{4-} \rightleftarrows \mathrm{FeG}^{-} & \beta_{\mathrm{FeG}}=\frac{\left[\mathrm{FeG}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{G}^{4-}\right]} \tag{2-2}
\end{array}
$$

- Considerable competitive reactions
- Acid-base equilibrium of a ligand $(L=Y$ or $G)$

$$
\begin{align*}
& \mathrm{H}_{4} \mathrm{~L} \rightleftarrows \mathrm{H}^{+}+\mathrm{H}_{3} \mathrm{~L}^{-} \quad K_{\mathrm{a} 1(\mathrm{~L})}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{H}_{3} \mathrm{~L}^{-}\right]}{\left[\mathrm{H}_{4} \mathrm{~L}\right]}  \tag{2-3}\\
& \mathrm{H}_{3} \mathrm{~L}^{-} \rightleftarrows \mathrm{H}^{+}+\mathrm{H}_{2} \mathrm{~L}^{2-} \quad K_{\mathrm{a} 2(\mathrm{~L})}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{H}_{2} \mathrm{~L}^{2-}\right]}{\left[\mathrm{H}_{3} \mathrm{~L}^{-}\right]}  \tag{2-4}\\
& \mathrm{H}_{2} \mathrm{~L}^{2-} \rightleftarrows \mathrm{H}^{+}+\mathrm{HL}^{3-} K_{\mathrm{a} 3(\mathrm{~L})}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HL}^{3-}\right]}{\left[\mathrm{H}_{2} \mathrm{~L}^{2-}\right]}  \tag{2-5}\\
& \mathrm{HL}^{3-} \rightleftarrows \mathrm{H}^{+}+\mathrm{L}^{4-} K_{\mathrm{a} 4(\mathrm{~L})}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{L}^{4-}\right]}{\left[\mathrm{H}^{3-}\right]} \tag{2-6}
\end{align*}
$$

- Hydrolysis of $\mathrm{Fe}^{3+}$

$$
\begin{align*}
& \mathrm{Fe}^{3+}+\mathrm{OH}^{-} \rightleftarrows \mathrm{FeOH}^{2+} \quad \beta_{\mathrm{Fe}(\mathrm{OH})_{1}}=\frac{\left[\mathrm{FeOH}^{2+}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{OH}^{-}\right]}  \tag{2-7}\\
& \mathrm{Fe}^{3+}+2 \mathrm{OH}^{-} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{2}^{+} \quad \beta_{\mathrm{Fe}(\mathrm{OH})_{2}}=\frac{\left[\mathrm{Fe}\left(\mathrm{OH}_{2}^{+}\right]\right.}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{OH}^{-}\right]^{2}}  \tag{2-8}\\
& \left.\mathrm{Fe}^{3+}+3 \mathrm{OH}^{-} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{3} \quad \beta_{\mathrm{Fe}(\mathrm{OH})_{3}}=\frac{\left[\mathrm{Fe}(\mathrm{OH})_{3}\right]}{[\mathrm{Fe}]}{ }^{3+}\right]\left[\mathrm{OH}^{-}\right]^{3}  \tag{2-9}\\
& \mathrm{Fe}^{3+}+4 \mathrm{OH}^{-} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{4}^{-} \tag{2-10}
\end{align*} \beta_{\mathrm{Fe}(\mathrm{OH})_{4}}=\frac{\left[\mathrm{Fe}(\mathrm{OH})_{4}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{OH}^{-}\right]^{4}}
$$

Polynuclear species $\left[\mathrm{Fe}_{2}(\mathrm{OH})_{2}\right]^{4+},\left[\mathrm{Fe}_{3}(\mathrm{OH})_{4}\right]^{5+}$, and $\left[\mathrm{Fe}_{12}(\mathrm{OH})_{34}\right]^{2+}$ are considered as well as mononuclear ones for more precise iron(III) speciation though they are neglected in this problem to avoid troublesome calculation ${ }^{8,9}$.

- Protonation and hydroxido species formation of a complex

$$
\begin{array}{cl}
\mathrm{FeHY} \rightleftarrows \mathrm{H}^{+}+\mathrm{FeY}^{-} & K_{\mathrm{a} 1(\mathrm{FeY})}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{FeY}{ }^{-}\right]}{[\mathrm{FeHY}]} \\
\mathrm{FeY}^{-}+\mathrm{OH}^{-} \rightleftarrows \mathrm{FeY}(\mathrm{OH})^{2-} & \beta_{\mathrm{FeY}(\mathrm{OH})_{1}}=\frac{\left[\mathrm{FeY}(\mathrm{OH})^{2-}\right]}{[\mathrm{FeY}]\left[\mathrm{OH}^{-}\right]} \\
\mathrm{FeG}^{-}+2 \mathrm{OH}^{-} \rightleftarrows \mathrm{FeG}(\mathrm{OH})_{2}{ }^{3-} & \beta_{\mathrm{FeG}(\mathrm{OH})_{2}}=\frac{\left[\mathrm{FeG}\left(\mathrm{OH}_{2}{ }^{3-}\right]\right.}{[\mathrm{FeG}]\left[\mathrm{OH}^{-}\right]^{2}} \tag{2-13}
\end{array}
$$

Of note, equilibria (2-1)-(2-13) are transformed into $p \mathrm{Fe}^{3+}+q \mathrm{~L}^{4-}+n \mathrm{H}^{+} \rightleftarrows \mathrm{Fe}_{\rho} \mathrm{L}_{q} \mathrm{H}_{r}{ }^{(3 p-4 q+r)}$ for facile calculation as shown in Table 1. The resulting equilibria and corresponding equilibrium constants $\beta_{p a r}$ are listed in equilibria (2-14)-(2-26). The overall equilibrium systems are described in Figure 2.

- Acid-base equilibrium of a ligand

$$
\begin{gather*}
\mathrm{L}^{4-}+\mathrm{H}^{+} \rightleftarrows \mathrm{HL}^{3-} \quad \beta_{011(\mathrm{~L})}=\frac{\left[\mathrm{HL}^{3-}\right]}{\left[\mathrm{L}^{4-}\right]\left[\mathrm{H}^{+}\right]}=\frac{1}{K_{\mathrm{a} 4(\mathrm{~L})}}  \tag{2-14}\\
\mathrm{L}^{4-}+2 \mathrm{H}^{+} \rightleftarrows \mathrm{H}_{2} \mathrm{~L}^{2-} \quad \beta_{012(\mathrm{~L})}=\frac{\left[\mathrm{H}_{2} \mathrm{~L}^{2-}\right]}{\left[\mathrm{L}^{4-}\right]\left[\mathrm{H}^{+}\right]^{2}}=\frac{1}{K_{\mathrm{a} 3(\mathrm{~L})} K_{\mathrm{a} 4(\mathrm{~L})}} \tag{2-15}
\end{gather*}
$$

$$
\begin{gather*}
\mathrm{L}^{4-}+3 \mathrm{H}^{+} \rightleftarrows \mathrm{H}_{3} \mathrm{~L}^{-} \quad \beta_{013(\mathrm{~L})}=\frac{\left[\mathrm{H}_{3} \mathrm{~L}^{-}\right]}{\left[\mathrm{L}^{4}\right]\left[\mathrm{H}^{+}\right]^{3}}=\frac{1}{K_{\mathrm{a} 2(\mathrm{~L})} K_{\mathrm{a} 3(\mathrm{~L})} K_{\mathrm{a} 4(\mathrm{~L})}}  \tag{2-16}\\
\mathrm{L}^{4-}+4 \mathrm{H}^{+} \rightleftarrows \mathrm{H}_{4} \mathrm{~L} \quad \beta_{014(\mathrm{~L})}=\frac{\left[\mathrm{H}_{4} \mathrm{~L}\right]}{\left[\mathrm{L}^{4-}\right]\left[\mathrm{H}^{+}\right]^{4}}=\frac{1}{K_{\mathrm{a} 1(\mathrm{~L})} K_{\mathrm{a} 2(\mathrm{~L})} K_{\mathrm{a} 3(\mathrm{~L})} K_{\mathrm{a} 4(\mathrm{~L})}} \tag{2-17}
\end{gather*}
$$

- Hydrolysis of $\mathrm{Fe}^{3+}$

$$
\begin{align*}
& \mathrm{Fe}^{3+}-\mathrm{H}^{+}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{FeOH}^{2+} \quad \beta_{10-1(\mathrm{Fe})}=\frac{\left[\mathrm{FeOH}^{2+}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{H}^{+}\right]^{-1}}=K_{\mathrm{w}} \beta_{\mathrm{Fe}(\mathrm{OH})_{1}}  \tag{2-18}\\
& \mathrm{Fe}^{3+}-2 \mathrm{H}^{+}+2 \mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{2}^{+} \quad \beta_{10-2(\mathrm{Fe})}=\frac{\left[\mathrm{Fe}(\mathrm{OH})_{2}^{+}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{H}^{+}\right]^{-2}}=K_{\mathrm{w}}{ }^{2} \beta_{\mathrm{Fe}(\mathrm{OH})_{2}}  \tag{2-19}\\
& \mathrm{Fe}^{3+}-3 \mathrm{H}^{+}+3 \mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{3} \quad \beta_{10-3(\mathrm{Fe})}=\frac{\left[\mathrm{Fe}(\mathrm{OH})_{3}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{H}^{+}\right]^{-3}}=K_{\mathrm{w}}{ }^{3} \beta_{\mathrm{Fe}(\mathrm{OH})_{3}}  \tag{2-20}\\
& \mathrm{Fe}^{3+}-4 \mathrm{H}^{+}+4 \mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{Fe}(\mathrm{OH})_{4}^{-} \quad \beta_{10-4(\mathrm{Fe})}=\frac{\left[\mathrm{Fe}(\mathrm{OH})_{4}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{H}^{+}\right]^{-4}}=K_{\mathrm{w}}{ }^{4} \beta_{\mathrm{Fe}(\mathrm{OH})_{4}} \tag{2-21}
\end{align*}
$$

where $K_{w}$ represents ionic product of water ( $K_{w}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]$).

- Complex formation, protonation, and hydroxido species formation of a complex

$$
\begin{align*}
\mathrm{Fe}^{3+}+\mathrm{Y}^{4-} \rightleftarrows \mathrm{FeY}^{-} & \beta_{110(\mathrm{FeY})}=\frac{\left[\mathrm{FeY}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{Y}^{4-}\right]}=\beta_{\mathrm{FeY}}  \tag{2-22}\\
\mathrm{Fe}^{3+}+\mathrm{Y}^{4-}+\mathrm{H}^{+} \rightleftarrows \mathrm{FeHY} & \beta_{111(\mathrm{FeY})}=\frac{[\mathrm{FeHY}]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{Y}^{4-}\right]\left[\mathrm{H}^{+}\right]}=\frac{\beta_{\mathrm{FeY}}}{K_{\mathrm{a} 1(\mathrm{FeY})}}  \tag{2-23}\\
\mathrm{Fe}^{3+}+\mathrm{Y}^{4-}-\mathrm{H}^{+}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{FeY}(\mathrm{OH})^{2-} & \beta_{11-1(\mathrm{FeY})}=\frac{\left[\mathrm{FeY}(\mathrm{OH})^{2-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{Y}^{4}\right]\left[\mathrm{H}^{+}\right]^{-1}}=K_{\mathrm{w}} \beta_{\mathrm{FeY}} \beta_{\mathrm{FeY}(\mathrm{OH})_{1}}  \tag{2-24}\\
\mathrm{Fe}^{3+}+\mathrm{G}^{4-} \rightleftarrows \mathrm{FeG}^{-} & \beta_{110(\mathrm{FeG})}=\frac{\left[\mathrm{FeG}^{-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{G}^{4-}\right]}=\beta_{\mathrm{FeG}}  \tag{2-25}\\
\mathrm{Fe}^{3+}+\mathrm{G}^{4-}-2 \mathrm{H}^{+}+2 \mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{FeG}(\mathrm{OH})_{2}^{3-} & \beta_{11-2(\mathrm{FeG})}=\frac{\left[\mathrm{FeG}(\mathrm{OH})_{2}^{3-}\right]}{\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{G}^{4-}\right]\left[\mathrm{H}^{+}\right]^{-2}}=K_{\mathrm{w}}^{2} \beta_{\mathrm{FeG}} \beta_{\mathrm{FeG}(\mathrm{OH})_{2}} \tag{2-26}
\end{align*}
$$

Figure 2. Expected chemical species in the complex formation equilibrium of $\mathrm{Fe}^{3+}$-EDTA and $\mathrm{Fe}^{3+}-\mathrm{GBT}$.

## 3. Solution for the problem

The total equilibrium system was integrated into a single equilibrium using conditional formation constant $\beta_{\text {FeL }}$ '.

$$
\begin{equation*}
\mathrm{Fe}^{\prime}+\mathrm{L}^{\prime} \rightleftarrows \mathrm{FeL}^{\prime} \quad \beta_{\mathrm{FeL}^{\prime}}=\frac{\left[\mathrm{FeL}^{\prime}\right]}{\left[\mathrm{Fe}^{\prime}\right]\left[\mathrm{L}^{\prime}\right]} \tag{3-1}
\end{equation*}
$$

where

$$
\left.\begin{array}{rl}
{\left[\mathrm{L}^{\prime}\right]} & =\left[\mathrm{L}^{4-}\right]+\left[\mathrm{HL}^{3-}\right]+\left[\mathrm{H}_{2} \mathrm{~L}^{2-}\right]+\left[\mathrm{H}_{3} \mathrm{~L}^{-}\right]+\left[\mathrm{H}_{4} \mathrm{~L}\right] \\
{\left[\mathrm{Fe}^{\prime}\right]} & =\left[\mathrm{Fe}^{3+}\right]+[\mathrm{FeOH} \\
\\
{\left[\mathrm{FeY}^{2}\right]} & ]+\left[\mathrm{Fe}(\mathrm{OH})_{2}^{+}\right]+\left[\mathrm{Fe}(\mathrm{OH})_{3}\right]+\left[\mathrm{Fe}(\mathrm{OH})_{4}^{-}\right]  \tag{3-5}\\
{\left[\mathrm{FeG}^{\prime}\right]} & =[\mathrm{FeGY}]+\left[\mathrm{FeY}(\mathrm{OH})^{2-}\right] \\
\hline
\end{array}\right]\left[\mathrm{FeG}(\mathrm{OH})_{2}^{3-}\right] .
$$

Total concentrations of a ligand and a ferric ion $c_{\mathrm{L}}$ and $c_{\mathrm{Fe}}$ are described as

$$
\begin{align*}
c_{\mathrm{L}} & =\left[\mathrm{L}^{\prime}\right]+\left[\mathrm{FeL}^{\prime}\right]  \tag{3-6}\\
c_{\mathrm{Fe}} & =\left[\mathrm{Fe}^{\prime}\right]+\left[\mathrm{FeL}^{\prime}\right] \tag{3-7}
\end{align*}
$$

Here, side reaction coefficients $\alpha_{L}, \alpha_{F e}$, and $\alpha_{F e L}$ are defined as

$$
\begin{align*}
\alpha_{\mathrm{L}} & =\frac{\left[\mathrm{L}^{\prime}\right]}{\left[\mathrm{L}^{4-}\right]}  \tag{3-8}\\
\alpha_{\mathrm{Fe}} & =\frac{\left[\mathrm{Fe}^{\prime}\right]}{\left[\mathrm{Fe}^{3+}\right]}  \tag{3-9}\\
\alpha_{\mathrm{FeL}} & =\frac{\left[\mathrm{FeL}^{\prime+}\right]}{\left[\mathrm{FeL}^{-}\right]} \tag{3-10}
\end{align*}
$$

The conditional formation constant $\beta_{\text {Fel }}$ ' is described by multiplying the original complex formation constant $\beta_{\text {FeL }}$ by a coefficient including side reaction coefficients.

$$
\begin{equation*}
\beta_{\mathrm{FeL}^{\prime}}=\frac{\left[\mathrm{FeL}^{\prime}\right]}{\left[\mathrm{Fe}^{\prime}\right]\left[\mathrm{L}^{\prime}\right]}=\frac{\alpha_{\mathrm{FeL}}\left[\mathrm{FeL}^{-}\right]}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{L}}\left[\mathrm{Fe}^{3+}\right]\left[\mathrm{L}^{4-}\right]}=\frac{\alpha_{\mathrm{FeL}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{L}}} \beta_{\mathrm{FeL}} \tag{3-11}
\end{equation*}
$$

In this problem, free metal ion concentration $\left[\mathrm{Fe}^{3+}\right]$ is required to figure out pFe .

$$
\begin{equation*}
\mathrm{pFe}=-\log \left[\mathrm{Fe}^{3+}\right] \tag{3-12}
\end{equation*}
$$

On the other hand, $\mathrm{pL}_{0.5}$ becomes

$$
\begin{align*}
\mathrm{pL}_{0.5}=-\log c_{\mathrm{L}} & =-\log \left(\left[\mathrm{L}^{\prime}\right]+\left[\mathrm{FeL}^{\prime}\right]\right) \\
& =-\log \left\{\left[\mathrm{L}^{\prime}\right]\left(1+\left[\mathrm{Fe}^{\prime}\right] \beta_{\mathrm{FeL}}{ }^{\prime}\right)\right\} \tag{3-13}
\end{align*}
$$

Since $50 \%$ of the metal cation bind to a ligand,

$$
\begin{gather*}
{\left[\mathrm{Fe}^{\prime}\right]=\left[\mathrm{FeL}{ }^{\prime}\right]=0.5 c_{\mathrm{M}}}  \tag{3-14}\\
\beta_{\mathrm{FeL}}{ }^{\prime}=\frac{1}{\left[\mathrm{~L}^{\prime}\right]} \tag{3-15}
\end{gather*}
$$

Also, total concentration of a ferric iron is trace relative to that of a ligand.

$$
c_{\mathrm{Fe}} \ll c_{\mathrm{L}} \Leftrightarrow c_{\mathrm{Fe}}-\left[\mathrm{FeL}^{\prime}\right] \ll c_{\mathrm{L}}-\left[\mathrm{FeL} \mathrm{~L}^{\prime}\right] \Leftrightarrow\left[\mathrm{Fe}^{\prime}\right] \ll\left[\mathrm{L}^{\prime}\right]
$$

Therefore, eq. (3-13) finally becomes

$$
\begin{align*}
\mathrm{pL}_{0.5} & =-\log \left(\left[\mathrm{L}^{\prime}\right]+[\mathrm{Fe} ']\right) \\
& =-\log \left[\mathrm{L}^{\prime}\right] \\
& =\log \beta_{\mathrm{FeL}}{ }^{\prime} \tag{3-16}
\end{align*}
$$

Accordingly, we need to calculate $\left[\mathrm{Fe}^{3+}\right]$ and $\beta_{\text {Fel }}$ ' to solve the problem. These parameters are found in order of $\alpha \rightarrow \beta_{\text {FeL }} \rightarrow\left[\mathrm{Fe}^{\prime}\right] \rightarrow\left[\mathrm{Fe}^{3+}\right]$.
(1) pFe

- EDTA
$\alpha_{Y}$ is expressed as a function of $\left[\mathrm{H}^{+}\right]$from the combination of eqs. (2-14)-(2-17), and (3-2).

$$
\begin{align*}
{\left[\mathrm{Y}^{\prime}\right] } & =\left[\mathrm{Y}^{4-}\right]+\left[\mathrm{H}^{3-}\right]+\left[\mathrm{H}_{2} \mathrm{Y}^{2-}\right]+\left[\mathrm{H}_{3} \mathrm{Y}^{-}\right]+\left[\mathrm{H}_{4} \mathrm{Y}\right] \\
& =\left[\mathrm{Y}^{4-}\right]\left(1+\beta_{011(\mathrm{Y})}\left[\mathrm{H}^{+}\right]+\beta_{012(\mathrm{Y})}\left[\mathrm{H}^{+}\right]^{2}+\beta_{013(Y)}\left[\mathrm{H}^{+}\right]^{3}+\beta_{014(Y)}\left[\mathrm{H}^{+}\right]^{4}\right)  \tag{3-17}\\
a_{Y} & =\frac{\left[\mathrm{Y}^{\prime}\right]}{\left[\mathrm{Y}^{4-}\right]}=1+\beta_{011(\mathrm{Y})}\left[\mathrm{H}^{+}\right]+\beta_{012(Y)}\left[\mathrm{H}^{+}\right]^{2}+\beta_{013(Y)}\left[\mathrm{H}^{+}\right]^{3}+\beta_{014(\mathrm{Y})}\left[\mathrm{H}^{+}\right]^{4} \tag{3-18}
\end{align*}
$$

Similar transformations are carried out for $\alpha_{\mathrm{Fe}}$, and $\alpha_{\mathrm{Fe}}$.

$$
\begin{gather*}
{[\mathrm{Fe}]=\left[\mathrm{Fe}^{3+}\right]+\left[\mathrm{FeOH}^{2+}\right]+\left[\mathrm{Fe}(\mathrm{OH})_{2}^{+}\right]+\left[\mathrm{Fe}(\mathrm{OH})_{3}\right]+\left[\mathrm{Fe}(\mathrm{OH})_{4}^{-}\right]} \\
=\left[\mathrm{Fe}^{3+}\right]\left(1+\beta_{10-1(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-1}+\beta_{10-2(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-2}+\beta_{10-3(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-3}+\beta_{10-4(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-4}\right)  \tag{3-19}\\
\alpha_{\mathrm{Fe}}=\frac{\left[\mathrm{Fe}^{\prime}\right]}{\left[\mathrm{Fe}^{3+}\right]}=1+\beta_{10-1(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-1}+\beta_{10-2(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-2}+\beta_{10-3(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-3}+\beta_{10-4(\mathrm{Fe})}\left[\mathrm{H}^{+}\right]^{-4}  \tag{3-20}\\
{\left[\mathrm{FeY}^{\prime}\right]=\left[\mathrm{FeY} \mathrm{Y}^{-}\right]+[\mathrm{FeHY}]+\left[\mathrm{FeY}(\mathrm{OH})^{2-}\right]} \\
=\left[\mathrm{FeY}^{-}\right]\left(1+\frac{\left.\beta_{111(\mathrm{FeY})}^{\beta_{110(\mathrm{FeY})}}\left[\mathrm{H}^{+}\right]+\frac{\beta_{11-1(\mathrm{FeY})}}{\beta_{110(\mathrm{FeY})}}\left[\mathrm{H}^{+}\right]^{-1}\right)}{}\right.  \tag{3-21}\\
\alpha_{\mathrm{FeY}}=\frac{\left[\mathrm{FeY}^{\prime}\right]}{\left[\mathrm{FeY}^{-}\right]}=1+\frac{\beta_{111(\mathrm{FeY})}}{\beta_{110(\mathrm{FeY})}}\left[\mathrm{H}^{+}\right]+\frac{\beta_{11-1(\mathrm{FeY})}}{\beta_{110(\mathrm{FeY})}}\left[\mathrm{H}^{+}\right]^{-1} \tag{3-22}
\end{gather*}
$$

$\left[\mathrm{H}^{+}\right]=10^{-7.4}$ is assigned to eqs. (3-18), (3-20), and (3-22).

$$
\begin{align*}
\alpha_{Y} & =1+661+38.0+7.76 \times 10^{-4}+3.09 \times 10^{-9}=700  \tag{3-23}\\
\alpha_{\mathrm{Fe}} & =1+1.70 \times 10^{5}+2.82 \times 10^{8}+8.91 \times 10^{7}+1.02 \times 10^{7}=3.81 \times 10^{8}  \tag{3-24}\\
\alpha_{\mathrm{FeY}} & =1+3.02 \times 10^{-6}+0.741=1.74 \tag{3-25}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{align*}
\beta_{\mathrm{FeY}}{ }^{\prime} & =\frac{\alpha_{\mathrm{FeY}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{Y}}} \beta_{\mathrm{FeY}} \\
& =\frac{1.74}{3.81 \times 10^{8} \times 700} 10^{25.10} \\
& =8.21 \times 10^{13} \tag{3-26}
\end{align*}
$$

From the combination of eqs. (3-6), (3-7), and (3-11), it is

$$
\begin{align*}
\beta_{\mathrm{FeY}}{ }^{\prime} & =\frac{\left[\mathrm{FeY}^{\prime}\right]}{[\mathrm{Fe}]\left[\mathrm{Y}^{\prime}\right]} \\
& =\frac{\left[\mathrm{FeY}^{\prime}\right]}{\left(c_{\mathrm{Fe}}-\left[\mathrm{FeY}^{\prime}\right]\right)\left(c_{\mathrm{Y}}-\left[\mathrm{FeY}^{\prime}\right]\right)} \tag{3-27}
\end{align*}
$$

Assign values of $c_{\mathrm{L}}=10^{-5} \mathrm{M}, c_{\mathrm{Fe}}=10^{-6} \mathrm{M}$ to eq. (3-27) and solve the quadratic equation of [FeY'] to find

$$
\begin{equation*}
\left[\mathrm{FeY}^{\prime}\right]=1.00 \times 10^{-6}-1.40 \times 10^{-15} \mathrm{M} \tag{3-28}
\end{equation*}
$$

From eq. (3-7),

$$
\begin{equation*}
[\mathrm{Fe}]=1.40 \times 10^{-15} \mathrm{M} \tag{3-29}
\end{equation*}
$$

Isolating $\left[\mathrm{Fe}^{3+}\right]$, eq. (3-20) finally becomes

$$
\begin{gather*}
{\left[\mathrm{Fe}^{3+}\right]=\frac{\left[\mathrm{Fe}^{\prime}\right]}{\alpha_{\mathrm{Fe}}}=\frac{1.40 \times 10^{-15}}{3.81 \times 10^{8}}=3.67 \times 10^{-24} \mathrm{M}}  \tag{3-30}\\
\mathrm{pFe}=-\log \left[\mathrm{Fe}^{3+}\right]=23.4 \tag{3-31}
\end{gather*}
$$

## - GBT

$\alpha_{G}$ is expressed as a function of $\left[\mathrm{H}^{+}\right]$from the combination of eqs. (2-14)-(2-17), and (3-2).

$$
\begin{align*}
{[\mathrm{G}] } & =\left[\mathrm{G}^{4-}\right]+\left[\mathrm{HG}^{3-}\right]+\left[\mathrm{H}_{2} \mathrm{G}^{2-}\right]+\left[\mathrm{H}_{3} \mathrm{G}^{-}\right]+\left[\mathrm{H}_{4} \mathrm{G}\right] \\
& =\left[\mathrm{G}^{4-}\right]\left(1+\beta_{011(\mathrm{G})}\left[\mathrm{H}^{+}\right]+\beta_{012(\mathrm{G})}\left[\mathrm{H}^{+}\right]^{2}+\beta_{013(\mathrm{G})}\left[\mathrm{H}^{+}\right]^{3}+\beta_{014(\mathrm{G})}\left[\mathrm{H}^{+}\right]^{4}\right)  \tag{3-32}\\
\alpha_{\mathrm{G}} & =\frac{\left[\mathrm{G}^{\prime}\right]}{\left[\mathrm{G}^{4-}\right]}=1+\beta_{011(\mathrm{G})}\left[\mathrm{H}^{+}\right]+\beta_{012(\mathrm{G})}\left[\mathrm{H}^{+}\right]^{2}+\beta_{013(\mathrm{G})}\left[\mathrm{H}^{+}\right]^{3}+\beta_{014(\mathrm{G)}}\left[\mathrm{H}^{+}\right]^{4} \tag{3-33}
\end{align*}
$$

Similar transformation is carried out for $\alpha_{\text {FeG }}$.

$$
\begin{align*}
{\left[\mathrm{FeG}^{\prime}\right] } & =\left[\mathrm{FeG}^{-}\right]+\left[\mathrm{FeG}(\mathrm{OH})_{2}^{3-}\right] \\
& =\left[\mathrm{FeG}^{-}\right]\left(1+\frac{\beta_{11-2(\mathrm{FeG})}}{\beta_{110(\mathrm{FeG})}}\left[\mathrm{H}^{+}\right]^{-2}\right)  \tag{3-34}\\
\alpha_{\mathrm{FeG}}= & \frac{\left[\mathrm{FeG}^{\prime}\right]}{\left[\mathrm{FeG}^{-}\right]}=1+\frac{\beta_{11-2(\mathrm{FeG})}}{\beta_{110(\mathrm{FeG})}}\left[\mathrm{H}^{+}\right]^{-2} \tag{3-35}
\end{align*}
$$

$\left[\mathrm{H}^{+}\right]=10^{-7.4}$ is assigned to eqs. (3-33) and (3-35).

$$
\begin{align*}
\alpha_{G} & =1+3.47 \times 10^{3}+70.8+0.209+1.55=3.54 \times 10^{3}  \tag{3-36}\\
\alpha_{\mathrm{FeG}} & =1+4.07 \times 10^{-7}=1.00 \tag{3-37}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{align*}
\beta_{\mathrm{FeG}} ' & =\frac{\alpha_{\mathrm{FeG}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{G}}} \beta_{\mathrm{FeG}} \\
& =\frac{1.00}{3.81 \times 10^{8} \times 3.54 \times 10^{3}} 10^{27.61} \\
& =3.02 \times 10^{15} \tag{3-38}
\end{align*}
$$

From the combination of eqs. (3-6), (3-7), and (3-11), it is

$$
\begin{align*}
\beta_{\mathrm{FeG}^{\prime}} & =\frac{\left[\mathrm{FeG}^{\prime}\right]}{\left[\mathrm{Fe}^{\prime}\right]\left[\mathrm{G}^{\prime}\right]} \\
& =\frac{\left[\mathrm{FeG}^{\prime}\right]}{\left(c_{\mathrm{Fe}}-\left[\mathrm{FeG}^{\prime}\right]\right)\left(c_{\mathrm{G}}-\left[\mathrm{FeG}^{\prime}\right]\right)} \tag{3-39}
\end{align*}
$$

Assign values of $c_{\mathrm{L}}=10^{-5} \mathrm{M}, c_{\mathrm{Fe}}=10^{-6} \mathrm{M}$ to eq. (3-39) and solve the quadratic equation of [ $\mathrm{FeY} \mathrm{Y}^{\prime}$ ] to find

$$
\begin{equation*}
\left[\mathrm{FeG}^{\prime}\right]=1.00 \times 10^{-6}-3.51 \times 10^{-17} \mathrm{M} \tag{3-40}
\end{equation*}
$$

From eq. (3-7),

$$
\begin{equation*}
[\mathrm{Fe}]=3.51 \times 10^{-17} \mathrm{M} \tag{3-41}
\end{equation*}
$$

Isolating $\left[\mathrm{Fe}^{3+}\right]$, eq. (3-20) finally becomes

$$
\begin{gather*}
{\left[\mathrm{Fe}^{3+}\right]=\frac{\left[\mathrm{Fe}^{\prime}\right]}{\alpha_{\mathrm{Fe}}}=\frac{3.51 \times 10^{-17}}{3.81 \times 10^{8}}=9.21 \times 10^{-26} \mathrm{M}}  \tag{3-42}\\
\mathrm{pFe}=-\log \left[\mathrm{Fe}^{3+}\right]=25.0 \tag{3-43}
\end{gather*}
$$

Calculation of pFe values indicated that the sequestering ability of GBT is 40 times higher than that of EDTA.
(2) $\mathrm{pL}_{0.5}$
(ii) $\mathrm{pH}=7.4$
pL 0.5 values are found by integrating eqs. (3-16), (3-26), and (3-38).

- EDTA

$$
\begin{align*}
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeY}}{ }^{\prime} \\
& =\log \left(8.21 \times 10^{13}\right)=13.9 \tag{3-44}
\end{align*}
$$

- GBT

$$
\begin{align*}
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeG}}{ }^{\prime} \\
& =\log \left(3.02 \times 10^{15}\right)=15.5 \tag{3-45}
\end{align*}
$$

(i) $\mathrm{pH}=2.5$
$\left[\mathrm{H}^{+}\right]=10^{-2.5}$ is assigned to eqs. (3-18), (3-20), (3-22), (3-33) and (3-35).

- EDTA

$$
\begin{align*}
\alpha_{Y}= & 1+3.16 \times 10^{-2}+2.40 \times 10^{11}+3.89 \times 10^{11}+1.23 \times 10^{11}=7.52 \times 10^{11}  \tag{3-46}\\
\alpha_{\mathrm{Fe}}= & 1+2.14+4.47 \times 10^{-2}+1.78 \times 10^{-7}+2.57 \times 10^{-13}=3.18  \tag{3-47}\\
\alpha_{\mathrm{FeY}}= & 1+0.240+9.33 \times 10^{-6}=1.24 \tag{3-48}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{align*}
\beta_{\mathrm{FeY}}{ }^{\prime} & =\frac{\alpha_{\mathrm{FeY}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{Y}}} \beta_{\mathrm{FeY}} \\
& =\frac{1.24}{3.18 \times 7.52 \times 10^{11}} 10^{25.10} \\
& =6.52 \times 10^{12}  \tag{3-49}\\
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeY}}{ }^{\prime}=12.8 \tag{3-50}
\end{align*}
$$

- GBT

$$
\begin{align*}
\alpha_{G} & =1+2.75 \times 10^{8}+4.47 \times 10^{11}+1.05 \times 10^{14}+6.17 \times 10^{13}=1.67 \times 10^{14}  \tag{3-51}\\
\alpha_{\mathrm{FeG}} & =1+6.46 \times 10^{-17}=1.00 \tag{3-52}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{align*}
\beta_{\mathrm{FeG}}{ }^{\prime} & =\frac{\alpha_{\mathrm{FeG}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{G}}} \beta_{\mathrm{FeG}} \\
& =\frac{1.00}{3.18 \times 1.67 \times 10^{14}} 10^{27.61} \\
& =7.67 \times 10^{12}  \tag{3-53}\\
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeY}}{ }^{\prime}=12.9 \tag{3-54}
\end{align*}
$$

(iii) $\mathrm{pH}=10.5$
$\left[\mathrm{H}^{+}\right]=10^{-2.5}$ is assigned to eqs. (3-18), (3-20), (3-22), (3-33) and (3-35).

- EDTA

$$
\begin{align*}
\alpha_{Y} & =1+0.524+2.40 \times 10^{-5}+3.89 \times 10^{-13}+1.23 \times 10^{-21}=1.52  \tag{3-55}\\
\alpha_{\mathrm{Fe}} & =1+2.14 \times 10^{8}+4.47 \times 10^{14}+1.78 \times 10^{17}+2.57 \times 10^{19}=2.59 \times 10^{19}  \tag{3-56}\\
\alpha_{\mathrm{FeY}} & =1+2.40 \times 10^{-9}+933=934 \tag{3-57}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{aligned}
& \beta_{\mathrm{FeY}} '^{\prime}=\frac{\alpha_{\mathrm{FeY}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{Y}}} \beta_{\mathrm{FeY}} \\
&=\frac{1.52}{2.59 \times 10^{19} \times 934} 10^{25.10} \\
& 8
\end{aligned}
$$

$$
\begin{align*}
= & 2.98 \times 10^{8}  \tag{3-58}\\
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeY}}{ }^{\prime}=8.47 \tag{3-59}
\end{align*}
$$

- GBT

$$
\begin{align*}
\alpha_{G} & =1+2.75+4.47 \times 10^{-5}+1.05 \times 10^{-10}+6.17 \times 10^{-19}=3.75  \tag{3-60}\\
\alpha_{\mathrm{FeG}} & =1+0.646=1.65 \tag{3-61}
\end{align*}
$$

Therefore, eq. (3-11) becomes

$$
\begin{align*}
\beta_{\mathrm{FeG}} & =\frac{\alpha_{\mathrm{FeG}}}{\alpha_{\mathrm{Fe}} \alpha_{\mathrm{G}}} \beta_{\mathrm{FeG}} \\
& =\frac{1.65}{2.59 \times 10^{19} \times 3.75} 10^{27.61} \\
& =6.90 \times 10^{7}  \tag{3-62}\\
\mathrm{pL}_{0.5} & =\log \beta_{\mathrm{FeY}}{ }^{\prime}=7.84 \tag{3-63}
\end{align*}
$$

Overall, Calculation of $\mathrm{pL}_{0.5}$ values indicated that the sequestering ability of GBT is 37 times higher than that of EDTA at pH 7.4 , but at the same level at pH 2.5 , and 4 times weaker at pH 10.5. The relationship between pH and pL 0.5 values of GBT and EDTA are described in Figure 3.

## Example of application of pLo.5 value calculation ${ }^{10}$

Helicobacter pylori produces Hpn protein which help the intracellular modulation of the amount of $\mathrm{Ni}^{2+}$. Since histidine potentially participates in the complex formation with neighboring residues, the $\mathrm{pL}_{0.5}$ values of N -terminal domain of Hpn proteins (MAHHEEQHG-Am) was investigated with that of its mutants obtained by substitution of one His residue with Ala (Ala-scan) to understand the role of each His in the coordination of metal ions. The binding affinities was compared for $\mathrm{Cu}^{2+}, \mathrm{Ni}^{2+}$ and $\mathrm{Zn}^{2+}$ ions, which are potentially competing metals in vivo (Table 2).
The pLo.5 values confirmed that His-3 plays an important role in binding $\mathrm{Cu}^{2+}$ and $\mathrm{Ni}^{2+}$. Also, it was revealed that the metal binding affinities follow the order $\mathrm{Cu}^{2+}>\mathrm{Ni}^{2+}>\mathrm{Zn}^{2+}$. In fact, the 3 -residues amino terminal metal-binding motif (MAH) works as the most efficient binding site for $\mathrm{Cu}^{2+}$ and $\mathrm{Ni}^{2+}$, while macrochelate $\mathrm{Zn}^{2+}$ complexes are formed thanks to the presence of several suitable anchoring sites (His and Glu).
The order of values suggested that the function of Hpn to capture $\mathrm{Ni}^{2+}$ is perturbed by the presence of $\mathrm{Cu}^{2+}$ even if in low amount. Actually, the interaction of $\mathrm{Ni}^{2+}-\mathrm{WT}$ complex with $\mathrm{Cu}^{2+}$ resulted in substitution of chelated metal species. The removed $\mathrm{Ni}^{2+}$ ion is proposed to be just released or moved to

Figure 3. The pH profile of the $\mathrm{pL}_{0.5}$ values for EDTA and gramibactin.
Table 2. $\mathrm{pL}_{0.5}$ values for different metal complexes with N -terminal domain of WT and that of its mutants at $\mathrm{pH}=7.4$.

|  | $\mathrm{Cu}^{2+}$ | $\mathrm{Ni}^{2+}$ | $\mathrm{Zn}^{2+}$ |
| ---: | ---: | ---: | ---: |
| WT | 12.27 | 8.21 | 5.49 |
| H3A | 9.23 | 5.28 | 4.34 |
| H4A | 12.25 | 8.23 | 4.14 |
| H8A | 12.24 | 7.95 | 3.76 |

Figure 4. Proposed molecular structure for the hetero-binuclear complex of N -terminal domain of Hpn protein. the secondary binding site to form a hetero-binuclear complex (Figure 4).
