(1) Please explain the reasonable reaction mechanisms.

Han, G.; Liu. Y.; Wang, Q. Org. Lett. 2013, 15, 5334.

## -Answer

1-1
1-3

1-8
1-9

(amidyl radical)
A. path a

-Discussion 1
single electron transfer to peroxide
see page 9 for the detail
oxidative radical cyclization

## -Discussion 2

Alternative mechanism of cascade cyclization - 5-exo/6-endo cyclization-

Since both 1-26 and 1-27 were obtained, the reaction mechanism should be 5-exo/5-exo cyclization.
(2) Please explain the reasonable reaction mechanisms and stereoselectivities.

ee was not mentioned, nut should be >95\%ee

Aubé, J.; Peng, X.; Wang, Y.; Takusagawa, F. J. Am. Chem. Soc. 1992, 114, 5466.

## prior to answer

Beckwith-Houk model for 5-exo radical cyclization

$R^{1}, R^{3}$ : pseudoequatorial

2 or 4-substituted system $\rightarrow$ trans-disubstituted product

## Answer

2-5-A

2-5-B

2-5-D

2-5-E

2-5-F

Considering the interaction between olefin and alkyl group on N, 2-5-A-2-5-C should be less favorable than 2-5-D-2-5-F.
Considering the interaction between OCu and sustituent of $\mathrm{C} 0,2-5-\mathrm{F}$ should be the most stable conformer.

Ph migration would proceed through 5,5-cis-fused intermediate (2-9).
Thus flip at nitrogen was considered.

alternative pathway from 2-11 to 2-13

consider the rotation of $\mathrm{C} 0-\mathrm{N}$ bond and $\mathrm{C} 4-\mathrm{C} 5$ bond

Considering the interaction between olefin and alkyl group on $\mathrm{N}, \mathbf{2 - 1 6 - A - 2 - 1 6 - C}$ should be less favorable than 2-16-D-2-16-F.
Considering the interaction between OCu and sustituent of $\mathrm{C}, \mathbf{2 - 1 6 - \mathrm { F }}$ should be the most stable conformer.

calculation of alkyl peroxide (calculated by Dr. Fujino)

most stable conformer ( $\Delta \mathrm{G}=0 \mathrm{kcal} / \mathrm{mol}$ )

second stable conformer ( $\Delta \mathrm{G}=+5.08 \mathrm{kcal} / \mathrm{mol}$ in gas phase, $+4.42 \mathrm{kcal} / \mathrm{mo}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ )
M06-2X/6-31+G(d) (gas phase) or M06-2X/6-31+G(d)/CPCM $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$

номо

LUMO

$$
\begin{aligned}
& \text { LUMO - HOMO: } \\
& 10.9 \mathrm{eV} \text { (gas phase) } \\
& 10.9 \mathrm{eV}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)
\end{aligned}
$$

LUMO+2
LUMO+2 - HOMO:
13.3 eV (gas phase)
$13.3 \mathrm{eV}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$

Judging from the calculation, single electron reduction should occur at $\mathrm{C}=\mathrm{O} \pi^{*}$ orbital.

or directly provide $R \bullet$ in concerted mechanism

A radical lowers the bond dissociation energy of adjacent $\mathrm{C}-\mathrm{H}$

## C Cooperative hydrogen atom transfer (cHAT)

West, J. G.; Huang, D. Sorensen, E. J. et al. Nat. Commun. 2015, 6, 10093.
The acidity of C-H adjacent to radical cation or conjugated to radical cation is high.

Jeffrey, J. L.; Petronijevic, F. R.; MacMillan, D. W. C.
J. Am. Chem. Soc. 2015, 137, 8404.
